

Specifically designed Drain Flow Pumps for combi steam ovens to pump away water without the need for expensive drainage systems.

Our Drain Flow Pumps are designed to collect and pump away waste water, at a temperature of up to 96 degrees centigrade, from a level as low as 40mm from the floor. The unit has gone on to become an almost essential part of a commercial kitchen set-up where floor gully drainage is absent or where ovens are sited away from drainage points. It is the only solution specifically designed for pumping waste water from island based combination ovens.

These units were designed in collaboration with a highly reputable oven manufacturer and have been successfully providing waste water solutions on all sizes and makes of major combi oven manufacturer products for the last decade.

Four pump sizes are available:

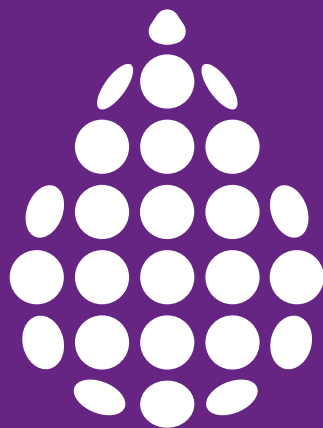

DPS01 – Suitable for all oven sizes up to 20 grid.

DPS02 – For all ovens 20 grid and above.

Both models are available in 40mm and 75mm versions.
